

SUNY KOREA SOLAR TEAM

SPONSORSHIP PACKET

A Student-led solar racing initiative connecting
SUNY Korea and **Stony Brook University**

We are building a long-term student engineering program focused on the design, development, testing, and racing of high-performance solar vehicles.

This packet is intended for general outreach and introduces who we are, where the team is headed, what support helps most, and how partners can take in the program's growth

WHAT THIS PACKET COVERS

WHO WE ARE

The team, program, and long-term vision.

WHERE WE ARE HEADED

Our roadmap toward international solar racing.

HOW PARTNERS CAN HELP

The kinds of support that strengthen the program.

About Us

The Team

The SUNY Korea Solar Team is a student-led multidisciplinary engineering organization and the first cross-campus, binational solar racing initiative composed of students from both SUNY Korea and Stony Brook University. Our mission is to design, build, test, and race high-performance solar-powered vehicles for major international competitions. In practice, that means turning classroom knowledge into real work in design, manufacturing, validation, systems integration, and team-based execution.

PROGRAM SNAPSHOT	
Campuses involved	SUNY Korea + Stony Brook University
Current student members	15+
Disciplines represented	Mechanical Engineering, Electrical & Computer Engineering
Faculty / technical advisors	4
Current development stage	Foundation building, technical training, and early prototype development
Primary long-term competition target	2029 Bridgestone World Solar Challenge (Challenger Class)

The Race

The Bridgestone World Solar Challenge (BWSC) is the team’s primary long-term competitive target. Held in Australia, it challenges university teams to design, build, and race solar-powered vehicles over roughly 3,000 kilometers from Darwin to Adelaide. It is widely regarded as the best-known solar car competition in the world and is demanding not only because of speed, but because of the level of reliability, efficiency, aerodynamic refinement, and team execution required to finish strongly.

For the SUNY Korea Solar Team, BWSC is more than a race target. It is the benchmark that shapes our technical standards, our development timeline, and the seriousness with which we approach vehicle design, testing, and operations.

Our Direction

Our Vision

The team is working to build more than a competition vehicle. Our goal is to establish a durable student-led engineering program that develops technical capability over multiple years, creates meaningful hands-on experience, and grows into a credible international solar racing effort. The long-term aim is a program that can represent SUNY Korea and its partners with professionalism, technical rigor, and continuity.

Roadmap

YEAR	FOCUS	PLANNED OUTPUT
2026	Foundation building	Formalize leadership, recruitment, training, sponsor outreach, and an early prototype pipeline.
2027	Technical development	Advance subsystem research, simulation, documentation standards, and early vehicle architecture work.
2028	Vehicle build & testing	Manufacture, assemble, integrate, and validate major systems through repeated testing and refinement.
2029	Competition debut	Complete final preparations and participate in the Bridgestone World Solar Challenge.

Current Activities

- Building the team’s leadership structure and internal workflows for long term success
- Running Fusion 360 education program on campus open to any interested students
- Researching BWSC rules, vehicle regulations, and subsystem architecture
- Developing early prototype and subsystem-level projects
- Establishing simulation and analysis capability, including ANSYS
- Expanding relationships with sponsors, advisors, and external partners

Partnership

The SUNY Korea Solar Team is looking to build a strong network of sponsors, technical partners, and supporters as we grow into a competitive solar racing program. Because the team is being built for the long term, outside support does more than fund a single activity: it helps create technical capability, accelerate real vehicle development, and strengthen the program’s ability to operate at an international level.

What Support Helps Most

Among the many ways to support our mission, financial support is especially impactful because it gives the team the flexibility to direct resources where they are needed most across vehicle development, materials, software, testing, logistics, and overall operations. At the same time, material, fabrication, software, and technical support can also make a major difference when aligned with the partner’s strengths.

Sponsorship Opportunities

This general packet keeps the partnership categories broad. More detailed one-page summaries and partner-specific proposals can be prepared separately when there is a clear fit.

AREA OF SUPPORT	EXAMPLES
Financial support	General team operations, vehicle development, tooling, testing, logistics, competition preparation
Manufacturing / fabrication	Machining, composite fabrication, molds, fixtures, brackets, enclosures, prototype parts
Materials / parts	Carbon fiber, fiberglass, resin systems, core materials, wiring, electronics, hardware, safety items
Software / technology	CAD, CFD, FEA, telemetry, cloud compute, electronics development, project tools
Testing / operations	Storage, transport, test space, instrumentation, safety equipment, event logistics
Technical guidance	Design reviews, subsystem advice, manufacturing feedback, mentoring, systems integration support

Partnership

Why Partner With Us

Partnering with the SUNY Korea Solar Team means supporting a serious student engineering effort built around a demanding real-world challenge. Solar racing compresses aerodynamics, structures, electrical systems, manufacturing, simulation, testing, logistics, and team operations into one integrated program. That makes it a strong platform for technical visibility, talent development, and long-term collaboration.

For general outreach, the value of partnership can be viewed in four broad areas that can later be tailored for individual organizations.

PARTNER VALUE	WHAT THAT CAN LOOK LIKE
Brand visibility	Recognition through team materials, digital platforms, outreach content, presentations, and branding on the vehicle where appropriate.
Talent development	Association with a hands-on engineering program that helps prepare future engineers through real design, build, and testing work.
Technical alignment	Connection to a project centered on efficiency, lightweight design, systems integration, and sustainable mobility.
Foundational partnership	Early involvement in a long-term program with room to grow, shape future collaboration, and build stronger brand association over time.

PARTNERSHIP TIERS	
Title Partner	Lead partner supporting the team at major level
Founding Partner	Early key partner helping establish the team’s foundation
Gold Partner	Major partner providing significant support
Silver Partner	Partner contributing meaningful targeted support
Bronze Partner	Partner providing valuable early-stage support

Sponsorship Tiers can be discussed after an initial conversation based on each organization’s interests, capabilities and preferred level of involvement.

Closing

Building the Future, Together

The SUNY Korea Solar Team aims to build more than a race vehicle. With the support of our partners, we hope to develop a long-term student engineering program centered on technical growth, hands-on learning, and international competition. Through this effort, we also aim to build a lasting network of partners connected by a shared commitment to innovation, talent development, and sustainable mobility.

Let's Start the Conversation

If your organization is interested in supporting student engineering, innovation and sustainable mobility, we would be glad to explore how we might work together to help strengthen the team's development, expand its capabilities, and support its future goals.

Ways to Support

Financial Support

Direct funding that helps the team design, build, test, and compete.

Technical Collaboration

Access to expertise, mentorship, and industry insight to advance the project.

Materials & Fabrication Support

Contribution of materials, components, or manufacturing resources.

Software & Equipment Support

Access to software, tools, and equipment that enables development.

Logistics & Operational Support

Assistance with travel, shipping, accommodations, and event logistics
